2021 Term 3 Lecture 12

What did we learn last lecture?

Introduction to Lighting

- Real world vs Simulation
- The possibilities of accurate simulation
- Phong Lighting due to processing limitations
- Beginning to look closely at the maths for Ambient and Diffuse lighting

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What are we covering today?

Continuing the deep dive into Phong Lighting

- Diffuse Lighting
- Specular Lighting
- Dealing with multiple lights

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Diffuse Lighting Walkthrough

Assignment Project Exam Help

<https://powcoder.com>

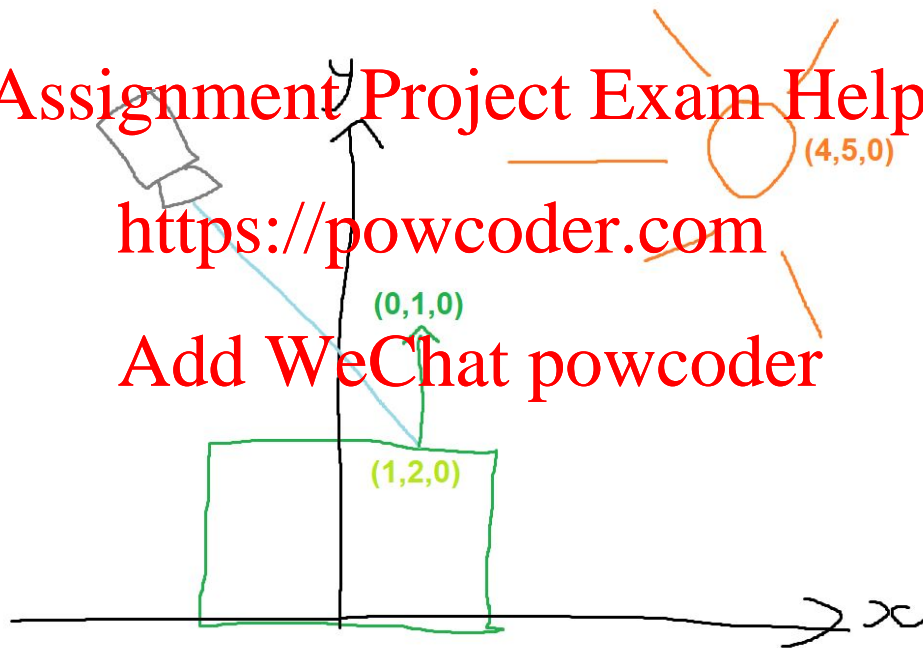

Add WeChat powcoder

A worked example

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

A worked example

Let's calculate some Ambient and Diffuse Lighting

- A scene with a light at (4,5,0)
 - The light's colours are (0.8, 0.8, 0.5), so a bit yellowish
- Ambient light is (0.1, 0.1, 0.1)
- The current fragment is at (1,2,0)
 - The surface normal is (0,1,0)
 - The diffuse reflective colour is (0.1, 0.8, 0.3), mostly green

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What Information do we have?

$$I_a + I_d = i_a * k_a + k_d * (L.N) * i_d$$

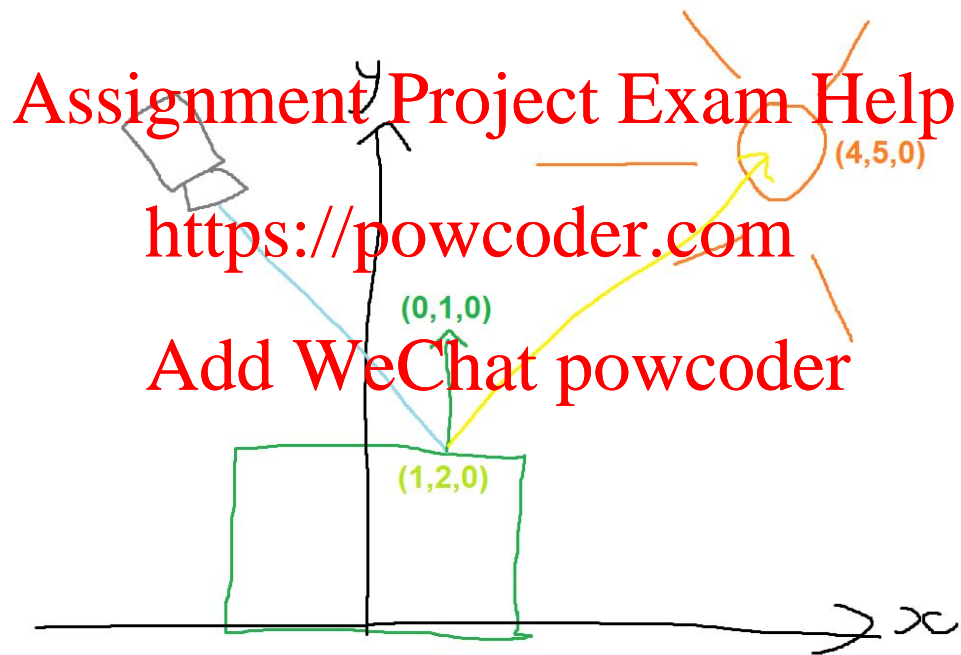

- $i_a = (0.1, 0.1, 0.1)$
- $k_a = (0.1, 0.8, 0.3)$ we're using the diffuse colour
- $k_d = (0.1, 0.8, 0.3)$
- L = needs to be calculated
- $N = (0, 1, 0)$
- $i_d = (0.8, 0.8, 0.5)$

L: Direction to the Light Source

Calculate L

L: Direction Vector aiming at the light

- We have a start and end of the vector
- $\text{end} - \text{start} = \text{vector}$
- Remember to Normalise!
- `Normalise((4, 5, 0) - (1, 2, 0))`
- `Normalise(3, 3, 0)` Divide the vector by its own length to normalise it!
- Remember Pythagorean Triangles? $a^2 + b^2 = c^2$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

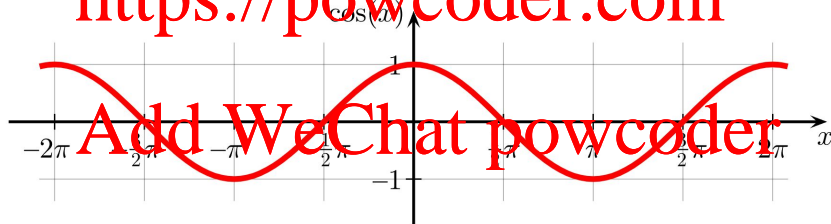

L.N

What does the dot product tell us?

- Dot product of two unit (length 1) vectors
- is the cosine of the angle between them

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The complete equation

$$I_a + I_d = i_a * k_a + k_d * (L.N) * i_d$$

- $I_a = (0.1, 0.1, 0.1) * (0.1, 0.8, 0.3)$
- $I_d = (0.1, 0.8, 0.3) * ((1/\sqrt{2}, 1/\sqrt{2}, 0) \cdot (0, 1, 0)) * (0.8, 0.8, 0.5)$
- $I_a + I_d = . . .$
- Try this out yourself!
- Also try changing the light position and see the effect

Add WeChat powcoder

In the Shaders

Our Graphics card will be doing this maths!

- Vertex Shader Outputs:
 - Fragment Position
 - Surface Normal (either generated from vertices or loped from normals at vertices)
 - Colour and/or TexCoord
- Fragment Shader Inputs:
 - the outputs above
 - Light Position or Direction
 - Light Colour
- Frag shader will calculate the Light Direction
- Frag shader will complete the algorithm and calculate the frag colour

Specular Lighting

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Specular Lighting Equation

$$I_s = k_s * (R \cdot V)^a * i_s$$

- I_s Final intensity of specular light
- k_s Specular reflectivity of the fragment
- R Direction of reflected light
- V Direction to the viewer
- a Phong Exponent
- i_s Specular intensity of light source

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

(R.V)^a - What's this part of the Equation?

Important directions for reflections

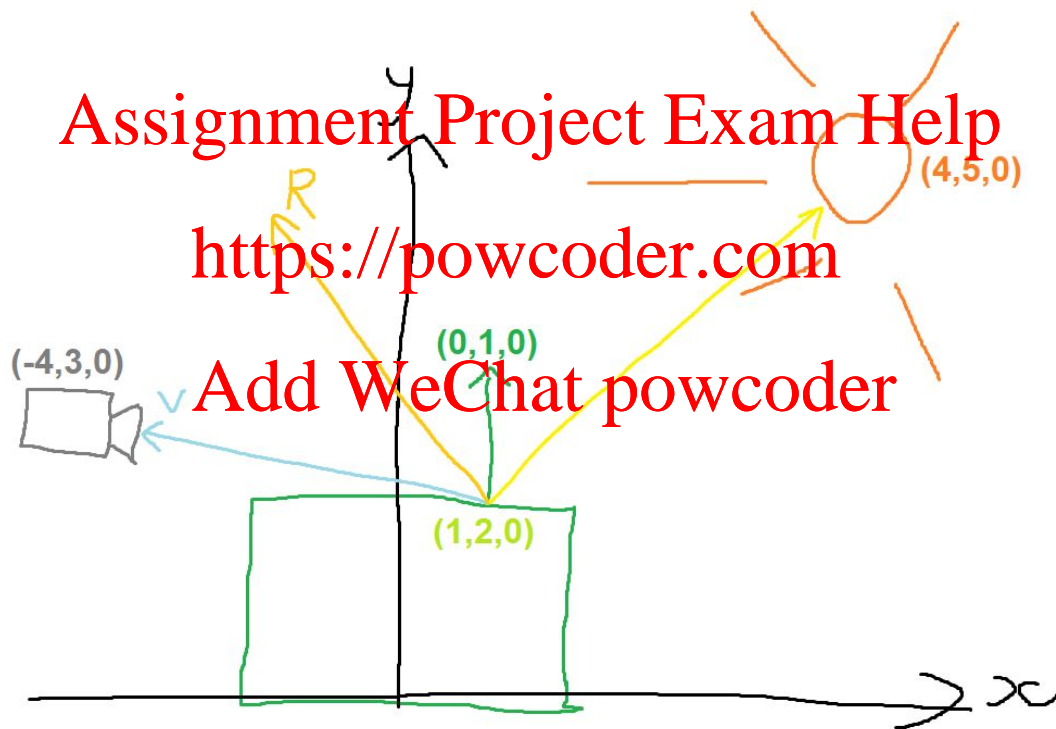

- **R** Direction of reflected light
 - Calculated based on the Light Direction and the Surface Normal
- **V** Direction to the viewer
 - The direction from the Fragment to the Camera
- This dot product is similar to the Diffuse Term
- How close is the reflected light to the camera?
- This means: Is the light reflecting directly into the camera?

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Reflected and Viewer Vectors

What is the Phong Exponent?

A measure of "shininess"

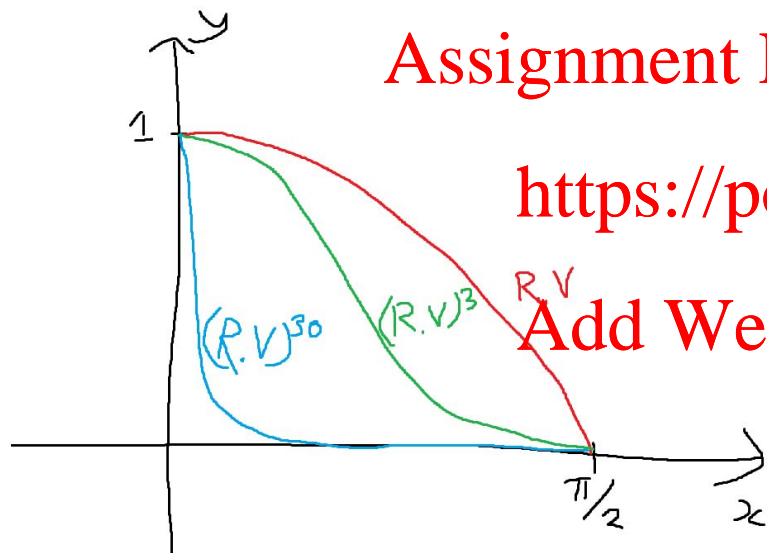

- An abstract concept, not grounded in reality
- The concept:
 - The shinier something is, the more focused a reflection is
 - Something less shiny still reflects the light, but in a "wider" fashion
- The maths:
 - R.V will be between 0 and 1
 - Any positive power of 0-1 will "narrow" its curve

Break Time

Phong's specular lighting

- The "bright spot" is like a reflection of the light source
- But it's all a trick! <https://powcoder.com>
- Our eyes are used to not being able to see a bright light reflected clearly
- So we just get a "splodge" of the light's colour
- Like being dazzled by brightness
- Specular highlights make us believe in metal, liquids etc

Specular Lighting Walkthrough

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Another worked example

Another worked example

Let's calculate some Specular Lighting

- A scene with a light at (4,5,0)
 - The light's colours are (0.8, 0.8, 0.5), so a bit yellowish
- Ambient light is (0.1, 0.1, 0.1)
- The current fragment is at (1,2,0)
 - The surface normal is (0,1,0)
 - The specular reflective colour is (1.0, 1.0, 1.0), it's pure reflective
- The camera is at (-4,3,0)
- The Phong Exponent is 20 (this can be experimented with!)

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The Equation

$$I_s = k_s * (R.V)^a * i_s$$

- $k_s = (1.0, 1.0, 1.0)$
- $L = \text{Normalise}((4, 5, 0) - (1, 2, 0))$
- $N = (0, 1, 0)$
- $R =$ needs to be calculated from L and N
- $V = \text{Normalise}((-4, 3, 0) - (1, 2, 0))$
- $a = 20$
- $i_s = (0.8, 0.8, 0.5)$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The Reflected Vector

Deciding the direction of a reflection

- We have a vector to the light \mathbf{L}
- and a surface normal \mathbf{N}
- A formula for reflection: $\mathbf{R} = 2 * (\mathbf{N} \cdot \mathbf{L}) * \mathbf{N} - \mathbf{L}$
- The maths behind this formula is interesting if you want to look it up
- \mathbf{R} will be a direction vector that is an exact reflection of \mathbf{L}
- $\mathbf{R} = 2 * 1/\sqrt{2} * (0, 1, 0) - (1/\sqrt{2}, 1/\sqrt{2}, 0)$
- $\mathbf{R} = (0, 2/\sqrt{2}, 0) - (1/\sqrt{2}, 1/\sqrt{2}, 0)$
- $\mathbf{R} = (-1/\sqrt{2}, 1/\sqrt{2}, 0)$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The complete equation

$$I_s = k_s * (R.V)^a * i_s$$

- $I_s = (1.0, 1.0, 1.0) *$

$$((-1/\sqrt{2}, 1/\sqrt{2}, 0) * (-5/\sqrt{26}, 1/\sqrt{26}, 0))^2 * (0.8, 0.8, 0.5)$$

- $I_s = . . .$

- Try moving the camera upwards to see the intensity change

In the Shaders

Again, our Graphics card will be doing the maths!

- Shaders will have similar inputs/outputs to earlier with Diffuse
- New Fragment Shader Input:
 - Camera/Viewer Position
- Frag shader will calculate the Reflected Direction (GLSL `reflect()`)
- Frag shader will complete the algorithm and calculate the frag colour
 - Adds together Ambient, Diffuse and Specular

Multiple Different Lights

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Multiple Lights and their different types

Different Types of Lights

- Directional Lights
- Point Lights
- Spot Lights

Assignment Project Exam Help

<https://powcoder.com>

Handling Multiple Lights in Phong Lighting

- Looping through multiple lights

Add WeChat powcoder

Directional Lights

Lights so far away, they don't have a position

- Represent distant lights like the Sun
- Represented by a direction vector
- Mathematically easy!
- We no longer calculate the vector to the light, we just use the light's vector

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Point Lights

We've been using these in our equations already!

- Lights with a location in the scene
- Represent smaller lights like lamps etc
- Use attenuation to make smaller lights more realistic
- Attenuation is the lowering of intensity based on distance

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Spot Lights

Modified Point Lights

- Represent objects like electric torches, vehicle headlights etc
- Adds an aim direction and a cutoff angle
- Some extra calculation needed to see if a fragment is inside the cutoff angle

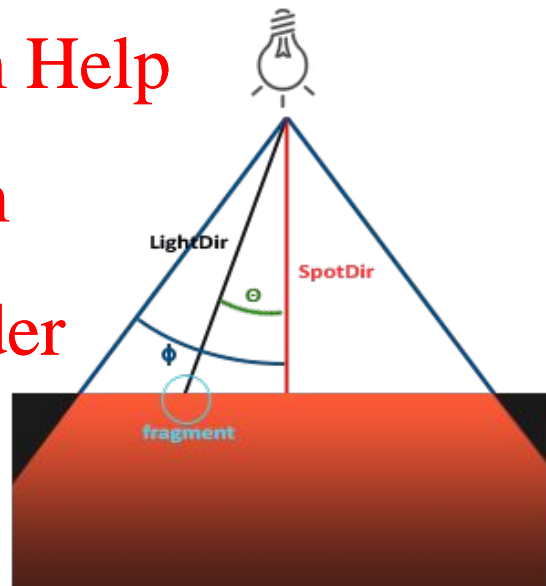

Image credit: learnopengl.com

Multiple Lights

How do we process multiple lights?

- The fragment shader will only run once per fragment
- Each fragment will have one colour, regardless of the number of lights!
- Different code for different lights!
- Calculate Ambient Light
- Loop through all Directional Light(s) diffuse and specular
- Loop through all Point Lights diffuse and specular
- Loop through all Spot Lights diffuse and specular

Phong Lighting

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

A discussion of Phong Lighting

Pros

- Computes fast
- A good approximation of real light
- Gives us directional lighting
- Gives a simple model for different materials
 - Just alter ambient/diffuse/specular reflectivity
- Can handle a few different light types
- Easy to modify to add capability

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

A discussion of Phong Lighting

Cons

- Doesn't always look realistic (you can tell it's not real light)
- Specular highlights can get a bit beyond real
- A few genuine issues with the maths
 - Colours can overflow their RGB values
 - Reflected vectors are limited to 0-90 degrees
- Scales by fragments * lights
 - The more lights and objects in a scene multiplies the amount of work for the frag shader

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

What did we learn today?

Completion of Phong Lighting

- Diffuse walkthrough
- Specular Lighting and walkthrough
- Working with different light types
- and multiple lights
- Some discussion of the pros and cons of Phong Lighting
- We're going to work on some of these issues next week!
